SUMMARY

Backend-leaning Software Engineer with 10 years on production systems at Europcar, Audi, Dassault, and Disneyland Paris. At Disney, co-led a pilot that became a multi-million-euro replacement of the legacy marketing platform. At Audi, built the labeling pipeline behind their autonomous-driving model training. Day-to-day work in Java, Kotlin, Scala, Kafka, PostgreSQL, and AWS/GCP.

EXPERIENCE

Software Engineer, Backend — Europcar International, Paris, France *Aug 2022 – Present*

- Built the customer authentication and account lifecycle on Kotlin/Spring Boot with Redhat-SSO/Keycloak — account creation, email verification, password reset, login, logout, account recovery, profile updates, account deletion, and email-based MFA.
- Built the token and API-security layer — JWT issuance and validation, refresh-token rotation, token introspection, silent token renewal, and API gateway integration.
- Set up the B2B identity surface — partner/corporate account provisioning and role and permission management within partner organisations — running through a single Keycloak instance shared with B2C.
- Worked across the wider reservation platform alongside the auth work — Kotlin microservices on Spring Boot, hexagonal/DDD, deployed on AWS through GitLab CI/CD.
- Rewrote slow PostgreSQL queries on the auth and account services; added composite indexes where lookups were doing full scans.

Results: Modernised the team's Gradle build setup with multi-level CI caching, cutting build times by ~50% (≈ 12 min $\rightarrow$ ≈ 5 min) — pattern adopted as the internal reference by 3+ adjacent JVM teams. Authored a C4-model architecture POC using Structurizr DSL and presented it to the team as a proposal for living architecture documentation; adopted by individual developers interested in learning the DSL.

Software Engineer, P.II — Dassault Systèmes, Paris, France *Mar 2022 – Jul 2022*

- Built a data quality tool that scanned Dassault's global online sales and product-referential systems for missing fields, broken references, and inconsistent values across millions of records.
- Started as a Python + SQL prototype on the internal stack, then rewrote it as a Java/Spring Boot service so it could plug into the regular release pipeline.
- Worked with business analysts to turn vague data-quality rules into actual checks the release process could run on its own.

Software Consultant — Lunatech SAS, Paris, France *Aug 2016 – Dec 2021*

Audi AG (Ingolstadt) — *Full-stack, Remote* *Aug 2018 – Dec 2021*

- Built an in-house labeling platform that produced ground-truth video data for Audi's autonomous-driving model training.
- Set the backend architecture early on, applying Play Framework's architectural patterns to the Akka-HTTP codebase to give it the structure and conventions a fast-growing team would need.
- Wrote the React + ScalaJS frontends used by the labelers, wired directly into the labeling backend.
- Set up role-based access with Forgerock IAM across the labeling tools and admin surfaces.
- Packaged services in Docker and ran them on GKE; integrated with Cloud TPU and Cloud AI Platform so model predictions could be used to pre-label data and speed up annotation.

Results: That early architectural call paid off as the team grew — multiple developers came onto the project later and could ship features quickly without spending time fighting the codebase or relitigating structure.

Disneyland Paris — Backend, On-site

Jan 2017 – Aug 2018

- Co-led the technical pilot for **D4th**, the new marketing platform integrating Tridion CMS with the Disneyland Paris public site (~10 million annual visitors).
- The pilot landed well enough that Disney funded a multi-million-euro programme on the back of it to fully replace the legacy marketing application.
- Wrote supporting microservices for browser push notifications and the SOAP integration with the older internal systems.

Results: Took on GitLab CI/CD setup and production deployment myself, even though both were outside my original scope — figured out the existing infrastructure, ran the initial deployments, and handed it off cleanly when a more experienced infra engineer joined.

UPS France — Full-stack, Remote

Aug 2016 – Jan 2017

- Worked on a B2B shipment-lifecycle platform — new features and maintenance — and added a Quartz-based scheduler that pushed automated reports to operations so delivery issues could be caught earlier.
- Deployed to AWS EC2 and handled day-to-day production: log analysis and incident triage.

Software Developer Intern — Nokia Bell Labs (formerly Alcatel-Lucent), Paris, France

Jul 2014 – Dec 2014

- Built a video-quality estimation tool in Java implementing the ITU-T P.1201.1 model; analysed streaming traffic with Wireshark and tcpdump as part of research into QUIC, HTTP/2, and H.264.

TECHNICAL SKILLS

Languages: Java, Kotlin, Scala, Python, JavaScript/TypeScript, SQL

Backend & APIs: Spring Boot, Play Framework, Akka-HTTP, REST, GraphQL, OpenAPI/Swagger, Hexagonal Architecture, Domain-Driven Design, BDD

Data & Messaging: PostgreSQL, Oracle, MySQL, Elasticsearch, Apache Kafka

Cloud & DevOps: AWS (EC2, S3, Lambda, API Gateway, RDS), GCP (GKE, Cloud SQL), Docker, Kubernetes, GitLab CI/CD, GitHub Actions, Gradle, Maven

Frontend & Tooling: React, ScalaJS, Vue.js, JUnit, Mockito, Cucumber, Linux, Claude Code, GitHub Copilot

EDUCATION

Diplôme Data Engineer — RNCP Niveau 7 — Sorbonne University / DataScientest — April 2026

- Hands-on coursework spanning data engineering and DevOps fundamentals — Kafka, PySpark, Airflow, MongoDB, Snowflake, dbt, FastAPI, Docker/Kubernetes, and Prometheus/Grafana.

Master's in Information Technology, Dual Degree — ISEP Paris, Grande École — Nov 2015

B.E. in Electronics & Telecommunications — University of Mumbai — Dec 2010

SPOKEN LANGUAGES

English (fluent) • French (B1) • Hindi (native) • Marathi (native)

PERSONAL PROJECTS

Self-hosted infrastructure — Self-host my own services on a small four-node Kubernetes cluster (K3s) I run on commodity hardware. Hands-on with the full delivery path — packaging, deployment, networking, observability — for real services I actually use.

Technical knowledge base — Author and self-host an mdBook-based reference of in-depth technical guides on data structures, algorithms, and system design. Live at notebook.kakde.eu.

OPEN SOURCE

- `eu.kakde.gradle.sonatype-maven-central-publisher` — Gradle plugin I authored and maintain, published on the official Gradle Plugin Portal. Publishes JVM artifacts to Maven Central through Sonatype's Central Portal API.
