SUMMARY

I am backend-leaning Software Engineer with over a decade of experience developing production systems for major corporation, including Europcar, Audi, Dassault, and Disneyland Paris. I recently completed a Data Engineering diploma at Liora x Sorbonne University (April 2026). At Disney, I helped led a pilot that became the foundation for a replacement of the legacy marketing platform at an investment of more than €22 million. At Audi, developed the in-house video annotation platform and data pipeline used to create ground-truth training data for autonomous driving training models.

EXPERIENCE

Europcar International, Paris, France - Software Engineer, Backend *Aug 2022 - Present*

- Implemented customer authentication and account lifecycle management services for 8+ Million customer accounts (B2B and B2C). Built using Kotlin/Spring Boot on top of RedHat SSO (KeyCloak).
- Successfully completed migration and consolidation of B2B and B2C accounts. Able to bring both accounts to a single layer of RedHat SSO (Keycloak) allowing personalization and segmentation capabilities to be consumed by downstream services that rely on ONE source of truth for customer profiles.
- Were able to decrease the p95 latency by ~20% for the busiest paths (authentication & account lookups) by re-writing the slowest queries in PostgreSQL and adding composite indexes where possible.
- Optimize Gradle build to make use of multi-level CI caching. The build times for our project decreased by around 35%.

Results: Contributed to the creation of our architecture documentation by utilizing a C4-model architecture proof of concept that I wrote up using Structurizr DSL. The approach for optimized Gradle build has been used as internal reference for multiple teams' company wide.

Dassault Systèmes, Paris, France - Software Engineer, P.II *Mar 2022 - Jul 2022*

- Developed a data quality tool to check online sales and product referential data (millions of records) for missing, bad or inconsistent information, etc.
- Initially it started out with a Python/SQL prototype but then developed this as a Java/Spring Boot service in the release pipeline for the Online-Sales and product-referential systems. In both cases I collaborated with business analysts to transform ambiguous data-quality rules into concrete checks that could be automated.

Lunatech SAS, Paris, France - Software Consultant *Aug 2016 - Dec 2021*

Audi AG (Ingolstadt) - Full-Stack Engineer, Remote *Aug 2018 - Dec 2021*

- Built an in-house ground truth labelling platform for training autonomous driving models at Audi and corresponding data pipeline. Total labelled frames from 2,000 driving videos: 5M+ frames. Automated validation for high label quality. Achieved label quality accuracy up to 98%+.
- Integrated Argo Workflows to build batch and async pipelines that pre-labelled data, which roughly doubled annotation throughput for ML teams.
- I improved the backend architecture early in my own time so as the codebase grew, it held up well throughout the project. This allowed other engineers to quickly add new functionality on top and enabled them to ship features ~40% faster.

Results: The early architecture I built held up through the entire project, scaling from prototype to 5M+ frames and 10+ engineers with no major rewrite required.

Disneyland Paris - Full-Stack Engineer, On-site *Jan 2017 - Aug 2018*

- Helped lead the technical pilot project for the new marketing platform that integrates with Tridion CMS for the public site of ~10M annual visitors.

- The pilot was very successful that Disney funded a multi-million-euro program for a full marketing application replacement called D4th (Disney 4th gen) - based off the Technical Pilot scope.
- Created supporting microservices (such as sending out browser push notifications) as well as a SOAP interface towards legacy internal systems.

Results: I took ownership of the pilot supporting services and built a GitLab CI/CD pipeline to take them live for D4th. This was then used by a senior infrastructure engineer to deploy the rest of the D4th system.

UPS France - Full-Stack Engineer, Remote

Aug 2016 - Jan 2017

- Worked on a B2B shipment-lifecycle platform (new features and maintenance); added a Quartz-based scheduler that pushed automated reports to operations so delivery issues could be caught earlier.
- Deployed to AWS EC2 and handled day-to-day production: log analysis and incident triage.

Nokia Bell Labs (formerly Alcatel-Lucent), Paris, France - Software Developer Intern *Jul 2014 - Dec 2014*

- Built a video-quality estimation tool in Java implementing the ITU-T P.1201.1 model; analysed streaming traffic with Wireshark and tcpdump as part of research into QUIC, HTTP/2, and H.264.

TECHNICAL SKILLS

Languages: Java, Kotlin, Scala, C/C++, Python, SQL, TypeScript

Backend & APIs: Spring Boot, GraphQL, OpenAPI/Swagger, Hexagonal Architecture, Domain-Driven Design, Scrum.

Identity & Access: Keycloak / RedHat SSO, OAuth2, OpenID Connect, JWT.

Data & Messaging: PostgreSQL, Oracle, MySQL, Elasticsearch, MongoDB, Apache Kafka

DevOps & Cloud: Linux, Docker, Kubernetes, GitLab CI/CD, GitHub Actions, Gradle, Maven, Prometheus & Grafana, AWS (EC2, S3, API Gateway, RDS, Lambda), GCP (GKE, Cloud SQL)

Frontend, Tooling & Other: Astro, React, Claude Code, VS Code, IntelliJ IDEA.

EDUCATION

Diplôme Data Engineer - Sorbonne University (Via Liora x DataScientest)

April 2026

- Hands-on coursework across Data Engineering and DevOps fundamentals: Kafka, PySpark, Airflow, MongoDB, Snowflake, dbt, FastAPI, Gitlab CI/CD, Docker/Kubernetes, and Prometheus/Grafana.

Master's in Information Technology (Dual Degree) - ISEP Paris, Grande École

Nov 2015

B.E. in Electronics & Telecommunications - University of Mumbai

Dec 2010

SOFT SKILLS

Intellectual curiosity · Time management · Analytical mindset · Strong interpersonal skills · Team player

LANGUAGES

English (fluent) · French (B1) · Hindi (native) · Marathi (native)

PERSONAL PROJECTS

Self-hosted homelab infrastructure - Run real, daily-use services on a self-managed Kubernetes cluster (K3s) built on commodity hardware. Hands-on across the full delivery path: packaging, deployment, networking, and observability.

Technical knowledge base - Built and self-host Synapse App (synapse.kakde.eu), a LeetCode-style DSA and system-design platform with code visualisations, custom widgets, running at several-hundred-user scale.

OPEN SOURCE

eu.kakde.gradle.sonatype-maven-central-publisher - Authored and maintaining Gradle plugin. It's published on the official Gradle Plugin Portal. This plugin helps to publish JVM artifacts to Maven Central through Sonatype's Central Portal API.
