SUMMARY

I am backend-leaning Software Engineer with over a decade of experience developing production systems for major corporation, including Europcar, Audi, Dassault, and Disneyland Paris. I recently completed a Data Engineering diploma at Liora x Sorbonne University (April 2026). At Disney, I helped led a pilot that became the foundation for a replacement of the legacy marketing platform at an investment of more than €22 million. At Audi, developed the in-house video annotation platform and data pipeline used to create ground-truth training data for autonomous driving training models.

TECHNICAL SKILLS

Languages: Java, Kotlin, Scala, Python, SQL, TypeScript.

Backend & APIs: Spring Boot, Play Framework, Akka-HTTP, ZIO, REST, GraphQL, OpenAPI/Swagger, Hexagonal Architecture, Domain-Driven Design, BDD

Data & Messaging: PostgreSQL, Oracle, MySQL, Elasticsearch, MongoDB, Apache Kafka

DevOps & Cloud: Linux, Docker, Kubernetes, GitLab CI/CD, GitHub Actions, Gradle, Maven, Prometheus & Grafana, AWS (EC2, S3, API Gateway, RDS, Lambda), GCP (GKE, Cloud SQL)

Frontend & Tooling: React, ScalaJS, Claude Code, VS Code, IntelliJ Idea.

EXPERIENCE

Europcar International, Paris, France - Software Engineer, Backend *Aug 2022 - Present*

- Built the customer authentication and account lifecycle on Kotlin/Spring Boot with Redhat-SSO/Keycloak - account creation, email verification, password reset, login, logout, account recovery, profile updates, and account deletion.
- Set up Keycloak as the shared identity layer for B2B and B2C, integrating customer profiles into a single source for downstream personalization and segmentation.
- Worked across the wider reservation platform alongside the auth work.
- Rewrote slow PostgreSQL queries on the auth and account services and added composite indexes where lookups were doing full scans.

Results: Authored a C4-model architecture POC using Structurizr DSL and presented it to the team as a proposal for living architecture documentation; adopted by individual developers interested in learning the DSL. Modernized the team's Gradle build setup with multi-level CI caching, cutting build times and simplifying architecture pattern - adopted as the internal reference by 3+ adjacent teams.

Dassault Systèmes, Paris, France - Software Engineer, P.II *Mar 2022 - Jul 2022*

- Built a data quality tool that scanned Dassault's global online sales and product-referential systems for missing fields, broken references, and inconsistent values across millions of records.
- Started this tool as a Python/SQL prototype, then rewrote it as a Java/Spring Boot service integrated into the release pipeline, partnering with business analysts to translate vague data-quality rules into automated checks.

Lunatech SAS, Paris, France - Software Consultant *Aug 2016 - Dec 2021*

Audi AG (Ingolstadt) - Full Stack Engineer, Full Remote *Aug 2018 - Dec 2021*

- Built Audi's in-house ground-truth labelling platform and data pipeline for autonomous-driving model training- handling vehicle video ingestion, frame extraction, labelling job distribution, and export of finished labels to training systems.
- Orchestrated batch and asynchronous workflows with **Argo Workflow**, integrated with cloud platform so model predictions could pre-label data and speed up annotation.

- Streamed labeling and annotation events through **Kafka**, indexed them into **Elasticsearch** to power dataset search, slicing, and quality dashboards used by ML and QA teams.
- Set the backend architecture early on so the codebase could absorb fast team growth without re-litigating structure later.

Results: That early architectural call paid off as the team grew - multiple developers came onto the project later and could ship features quickly without spending time fighting the codebase or relitigating structure.

Disneyland Paris - Full Stack Engineer, On-site

Jan 2017 - Aug 2018

- Helped lead the technical pilot **D4th** (Disney 4th gen), the new marketing platform integrating Tridion CMS with the Disneyland Paris public site (~10 million annual visitors).
- The pilot landed well enough that Disney funded a multi-million-euro program on the back of it to fully replace the legacy marketing application.
- Wrote supporting microservices for browser push notifications and the SOAP integration with the older internal systems.

Results: Took on GitLab CI/CD setup and production deployment myself, even though both were outside my original scope - Figured out the existing infrastructure, Ran the initial deployments, and handed it off cleanly when a more experienced infra engineer joined later.

UPS France - Full-stack, Remote

Aug 2016 - Jan 2017

- Worked on a B2B shipment-lifecycle platform - new features and maintenance - Added a Quartz based scheduler that pushed automated reports to operations so delivery issues could be caught earlier.
- Deployed to AWS EC2 and handled day-to-day production: log analysis and incident triage.

Software Developer Intern - Nokia Bell Labs (formerly Alcatel-Lucent), Paris, France *Jul 2014 - Dec 2014*

- Built a video-quality estimation tool in Java implementing the ITU-T P.1201.1 model; analyzed streaming traffic with Wireshark and tcpdump as part of research into QUIC, HTTP/2, and H.264.

EDUCATION

Diplôme Data Engineer Liora x Sorbonne University - *April 2026*

- Hands-on coursework spanning Data Engineering and DevOps fundamentals - Kafka, PySpark, Airflow, MongoDB, Snowflake, dbt, FastAPI, Docker/Kubernetes, and Prometheus/Grafana.

Master's in Information Technology, Dual Degree - ISEP Paris, Grande École - *Nov 2015*

B.E. in Electronics & Telecommunications - University of Mumbai - *Dec 2010*

SOFT SKILLS

Intellectual curiosity • Time Management • Analytical Mind • Good Interpersonal Skills • Team Player

LANGUAGES

English (fluent) • French (B1) • Hindi (native) • Marathi (native)

PERSONAL PROJECTS

Self-hosted infrastructure - Self-host my own services on a small four-node Kubernetes cluster (K3s) I run on commodity hardware. Hands-on with the full delivery path - packaging, deployment, networking, observability - for real services I actually use.

Technical knowledge base - Self-host a knowledge guide over my personal portfolio site, contains in-depth technical guides on data structures, algorithms, and system design. Live at cortex.kakde.eu

OPEN SOURCE

- **[eu.kakde.gradle.sonatype-maven-central-publisher](#)** - Gradle plugin I authored and maintain, published on the official Gradle Plugin Portal. Publishes JVM artifacts to Maven Central through Sonatype's Central Portal API.
